

Sightseeing on Shasta Lake

and a little underwater history

Shasta Unit • Whiskeytown - Shasta-Trinity National Recreation Area
Shasta-Trinity National Forest

Shasta Lake's many arms and inlets make it a paradise for explorers and boaters alike. The four major arms of the lake offer spectacular scenery as well as unusual geologic and historic areas of interest. Much of Shasta Lake's 29,500 acre surface area is accessible only by boat. This brief guide will point out some of the most outstanding features in and around each arm of the lake. Maps of the lake are available at the Shasta Lake Visitor Information Center.

The town of Kennett

The Sacramento Arm

This is the busiest and most developed arm of Shasta Lake. The historic route of the Oregon trail and the Central Pacific Railroad lie submerged below its surface. Interstate 5, the Oregon Trail's modern replacement, provides easy access to most of the areas on the Sacramento Arm.

Shasta Dam, located on the lower end of the Sacramento arm, is the second largest concrete dam in the United States. The 602 foot high dam is 30 feet thick at the top, 883 feet thick at the base and contains 6.3 million cubic yards of concrete. The visitor center at the dam offers films and displays showing highlights of dam construction during the 1940s. Visitors can also see many of the side benefits provided by Shasta Lake, "Keystone of the Central Valley Project.

Directly north of the dam and under about 400 feet of water lies the copper mining town of Kennett founded during the gold rush of the 1850s. Kennett's population boomed to nearly 10,000 residents in the early 1900s due to the high demand for copper which was more prevalent than gold in the surrounding hills. Sulphur damage from the town's five smelters destroyed nearly all the vegetation within a 15 mile radius of the town and, combined with declining copper prices after World War I, led to the demise of the town after 1925 and the closing of the smelters.

The aftermath of the denudation of the steep hillsides in the area was a mammoth erosion problem which still persists to some extent to this day. Over a million check dams were built and millions of trees were planted in an attempt to restore the natural appearance of the area. Some areas are still barren due to poor soil conditions. The rehabilitation efforts can be readily seen by taking a cruise up big Backbone Creek inlet.

Near the convergence of the Pit and Sacramento Arms is Slaughterhouse Island, so named because the slaughterhouse for Kennett sat in the saddle between what is now Slaughterhouse Island and the island to the south of it. Elmore Bay was named for the Elmore Ranch which was inundated by the rising waters of Shasta Lake.

From Gooseneck Cove north, watch for red volcanic looking rocks, called basalt, lining the shoreline. It occurs particularly on the west shore. This lava from the Mt. Shasta area was cut through by the erosive action of the historic Sacramento River. In some areas near Antlers, basalt forms crude columns similar to those found at Devil's Postpile National Monument.

At the north end of the Sacramento Arm are the Lakehead/Lakeshore area resorts and campgrounds. Gregory Creek got its name from the Gregory Ranch and Antlers Resort which was originally a railroad stop at the hotel adorned with deer antlers. Across from Antlers Resort is Indian Creek and a short way up the creek is a cool waterfall, a popular side trip on a hot day. The Sacramento Arm of the lake ends near Riverview, an old resort site. This site has one of the few sandy beaches on the lake.

The McCloud Arm

The McCloud River, from which this arm of Shasta Lake takes its name, was named for Alexander R. McCleod, a Scot fur trapper who was snowbound along the river in 1829. Little of the land along the McCloud River was ever developed. In 1872 Livingston Stone established the first West Coast salmon hatchery near the confluence of

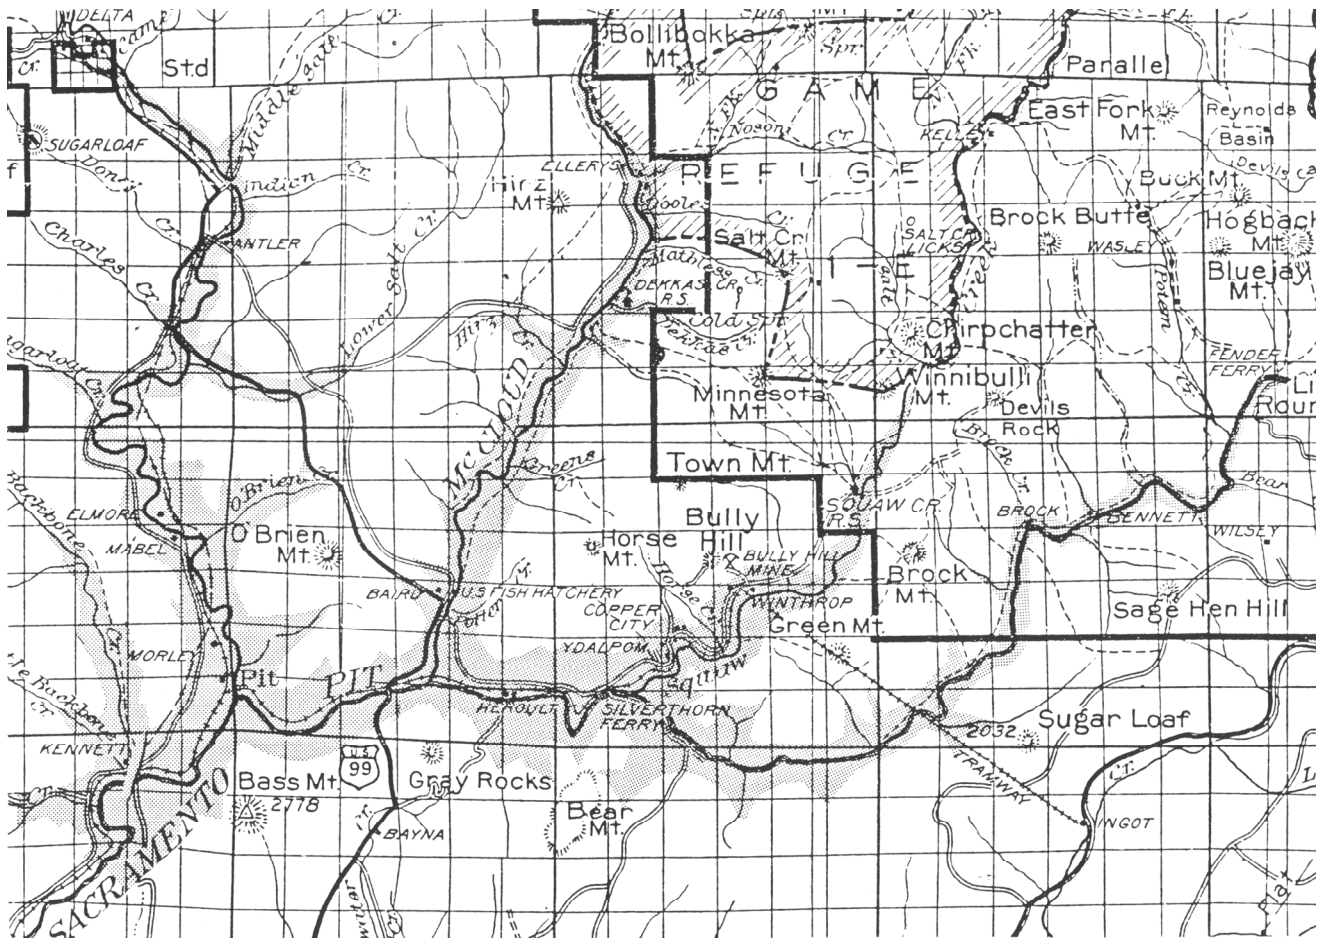

U.S. Fish Hatchery at Baird

the McCloud and Pit Rivers. The facility, which grew to resemble a small town, was called Baird in honor of the first commissioner of fishing. Seven years later, a trout hatchery was established at Green's Creek farther up the river. Rainbow trout from this hatchery were transplanted all over the world and most strains of rainbows are descendants of the McCloud River trout.

Above the McCloud Arm are towering grey limestone mountains, formed from ocean sediments that accumulated 200—300 million years ago. The Grey Rocks, as they are called, are full of the fossilized remains of corals, snails, clams and other sea creatures that existed in pre-historic times. Water running through cracks in the formation have slowly opened up two fairly well known caverns within the mountains. Local Wintu Indians knew the caverns well and told Livingston Stone about them. Livingston was the first European to visit the caverns. Commercially operated, guided tours of Shasta Caverns are available. Private boats can join the tour on the east shore where the ferry ties up.

Samwel Cave, also known as the “Cave of the Lost Maiden,” is located about two miles south of the McCloud Bridge (across the lake from Ellery Creek Campground). The cave was believed to contain magic pools in which the Wintu Shaman (medicine men) would bathe. It is also known for its treasure of Ice Age fossils which were found at the bottom of a 75 foot deep pit. Also in that pit were found the skeletal remains of the “Lost Maiden” which lent credence to the old Wintu stories. The variety and quality of remains excavated from the cave are surpassed only by those from the La Brea Tar Pits in Los Angeles.

Portion of the 1931 Shasta National Forest Map - (shaded area represents the approximate location of Shasta Lake)

A self guided, boat access only, trail leads up to Samwel Cave from Point McCloud. All but the first room is closed to the public because of the danger of falling to the bottom of the deep pit inside the cave. Spelunkers can explore the inner reaches of the cave by obtaining a one day permit issued by the Shasta Lake Visitor Center. A deposit is required for the key.

Several small ranches were once located along the upper McCloud River. The Ellery Ranch lies below the Ellery Creek Campground and extended up as far as the McCloud Bridge Campground. Fruit trees, berries and sweet peas, found in the McCloud Bridge Campground, are a reminder of the valley's agricultural past.

The Pit River Arm

This is the longest arm of the lake. From its confluence with the Sacramento Arm, near Shasta Dam, it stretches nearly 30 miles east to its upper end at the base of Pit Reservoir # 7 near Fenders Flat.

The lower part of the Pit is a wide basin with grand vistas. Mt. Shasta is visible to the north and Mt. Lassen and the Lassen Range backdrop the views up the Pit throughout much of the lower portion. Bass Mountain to the south and O'Brien Mountain to the north of the channel are examples of volcanic mountain building processes. Each is a 400 million year old volcanic plug. About 50 million years after the formation of these peaks, sea deposits began accumulating around them. These deposits were later compressed into the lime stones which now form Grey Rocks. These formations flank both sides of the Pit River just east of its confluence with the McCloud Arm.

At the bottom of the canyon lies the remains of the Sacramento Valley and Eastern Railroad—a line built at company expense to link the mines at Bully Hill on the Squaw Creek Arm, to the Southern Pacific lines along the Sacramento River.

The largest inland marina on the West Coast is located at Bridge Bay. High above Bridge Bay and the lake is the Pit River Bridge, the highest double decked bridge in the United States. This bridge replaced the Lower Pit River

Bridge which was inundated by Shasta Lake. Early day travelers crossed the river via ferries.

At the Silverthorn peninsula farther east, the Pit turns sharply south and begins to narrow. This is called the Upper Pit. After passing Jones Valley Inlet, there are no services and camping is limited to one primitive boat access only campground. This is Shasta Lake's "outback." It is home to eagles, osprey, otters and bear. It is considered by many to have the best bass fishing on the lake. Dozens of coves and inlets line the forested shores offering quiet, secluded campsites.

The Upper Pit was not cleared prior to the completion of Shasta Dam. World War II broke out about the same time the clearing crews got to the confluence of the Pit and Squaw arms and most of the men on the clearing crews left for the war. Standing dead trees (snags) sometimes lend an eerie appearance to the shoreline here and can be a hazard to boaters. Because of this, waterskiing has been prohibited above Arbuckle Flat.

Near the upper end of the arm, the channel becomes very narrow and the canyon walls are extremely steep. At Bear Creek, on the south side about 3½ miles above Stein Creek, a short hike leads to a double waterfall known as Bear Creek Falls. Potem Falls, a larger waterfall, can be found on Potem creek near Fenders Flat. This fall can be reached by trail from the lake or from Fenders Ferry Road.

From its northeast confluence with the Pit River Arm, near Silverthorn, the lake is rugged and remote. Gravel beaches and numerous fingers reach out into the channel making it one of the lake's most popular house boating areas. For the first several miles up the arm the shoreline is less steep than elsewhere on the lake and many desirable undeveloped campsites dot the shore.

This arm is also home to a large concentration of wildlife. Eagles, osprey, otter, bear and Rocky Mountain Elk are likely to be seen. Some shoreline areas are closed to protect critical habitats. Please respect these closures by staying out of designated areas.

To the north, several miles from the confluence, the ruins of Bully Hill Mines can be seen on a flat just above the north shore of the lake. Bully Hill was one of five major local mines located in the area prior to the construction of Shasta Dam. Others included Mountain Copper, Mammoth, Balaklala and Afterthought. Transportation problems, the presence of zinc in the copper ore, and lawsuits against the mines for Sulphur fume damage to vegetation led to their closure.

Main Street in Delamar

This area was first mined for its copper by the Wintu Indians. Hundreds of Chinese labors followed and mined over three miles of the creek bed. The ore yielded 98 percent pure copper, but it had to be shipped to the Atlantic Coast for refining and therefore was not profitable.

Later, Captain Delamar of Utah built the Bully Hill smelter and started processing copper locally. The town of Delamar, named for the captain, grew up below the smelter. In its heyday, the mine and smelter employed 2000 men and the town of Delamar housed from two to three times that many people. Horses and mules moved the

ore from the mine to the smelter or to Copper City downstream.

Today, the shoreline of Shasta Lake usually laps at Main Street, about mid way through Delamar. Above the town site, old gates mark the entrance to the Bully Hill Mine and Smelter complex. Mountains of tailings, dumped after the ore was ground up by hard milling stones brought from Sweden, surround the crushing area of the plant. The blast furnace foundations are easily identified by their fire brick linings and the piles of burnt slag surrounding them. High on the hill is the former electric plant and its round window overlooking the town and the lake.

Beyond Bully Hill lies Monday Flat, an undeveloped camping area reached via Fenders ferry Road. After Monday Flat there is a sharp bend in the Squaw Creek Arm.

The arm becomes narrow and trees crowd the shoreline. Soon, limestone cliffs flank both sides of the arm. These lime stones are about a million years younger than those found at Grey Rocks around Shasta Caverns. Close examination may reveal the fossil remains of lilies and aquatic animals. The Squaw Creek Arm becomes extremely narrow at its upper end. Watch out for submerged rocks!

The Bully Hill Smelter

For more information

We sincerely hope that you enjoy your sightseeing trip around Shasta Lake.

If you have any questions about what to see and do, please write or call the Shasta Lake Ranger Station at:
